

TOVU AI

The AI-Native CMS That Replaces WordPress

What WordPress would be if it were invented today.

WordPress Powers 43% of the Web. It Was Built in 2003.

No AI Integration

Bolted on as an afterthought. Not native to the core architecture.

No Edge Deployment

Stuck on 2003-era LAMP hosting. Slow delivery to global users.

No Plugin Sandboxing

Security Nightmares: Any plugin can nuke your database.

Database Anti-Pattern

EAV is exponentially slower at scale. WP_Query is a bottleneck.

No Type Safety

PHP spaghetti code and untestable global state make maintenance painful.

High Latency

200-500ms minimum latency on every save. Real-time collaboration is impossible.

The platform running most of the internet is **architecturally frozen**.

\$35B Market. Incumbents Can't Adapt.

Tovu: **AI-Native CMS**, Framework-Agnostic, Agent-Ready

Four things WordPress can never be.

01

AI Agents on Both Sides

Visitors talk to intelligent agents on the site for instant answers. Employees work with specialized agent teams internally to automate operations with Agentic UI

02

Agent-Ready Frontend

Built-in agentic surface for auto form-filling, button interaction, navigation, and content querying with AG-UI. Works seamlessly with any framework.

03

Secure by Default

No more database nuking. Sandboxed plugins run with strictly declared permissions, isolating code and protecting your core data.

04

Zero Lock-in

The headless CMS and hexagonal architecture allows you to swap your frontend framework, database, or AI model with a single configuration line.

Hexagonal Core. Swap Everything.

The Core

Pure TypeScript, zero dependencies. Contains the content engine, hook system, plugin runtime, and MCP protocol layer.

Data & Search

Supabase/Postgres + pgvector for native semantic search. No legacy WP database schema.

Frontend Agnostic

Agent-ready surface layer handles form-filling and navigation. React, Vue, Svelte, or Astro.

Universal Adapters

Swap any layer without touching core. "Next.js dies? Write one adapter. Core untouched."

Two AI Surfaces. One Platform.

For Site Visitors

Conversational Interface

Do you have this shirt in navy blue, size M?

Yes! We have 3 in stock.

Add to Cart

- ✓ **Answers & Recommends**
Instant product advice and support.
- ✓ **Navigates & Fills Forms**
Agentic UI handles the boring interactions.
- 🛡️ **Safe Guardrails**
Host defines strict interaction limits.

For Employees

Specialized Agent Team

Agent	Role Description	Access Level
 Writer	Drafts, edits, translates content	Content API
 Publisher	Schedules, optimizes, distributes	Public API
 Commerce	Manages products, pricing, orders	Stripe/DB
 Database	Queries, reports, analytics	Read-Only
 SEO	Audits, keyword research, meta	Meta API

Leadership defines access. Every plugin auto-exposes its tools to agents via MCP (Model Context Protocol).

Tovu vs. WordPress

Why the architecture matters

FEATURE	 WordPress  Tovu	
AI for Visitors	 None	 Conversational Agents
AI for Employees	 None	 Specialized Agent Team
Agent-ready Frontend	 None	 Auto form-fill, navigation
Plugin Security	 Unrestricted	 Sandboxed + Permissions
Save Latency	200-500ms	 <10ms (Local-first)
Type Safety	None (PHP)	End-to-end TypeScript
Edge Deploy	 Impossible	Native
E-commerce	WooCommerce (Plugin)	 Native + AI-Powered
Real-time	Polling	Built-in Sync

Four Revenue Streams

Diversified monetization across the ecosystem

Primary Driver

01

AI Conversation Ads

Shared Revenue Model

Visitor-facing agents surface contextual, sponsored results directly within the conversation. We share profit with hosts.

→ "The Google AdSense model, rebuilt for conversational AI."

02

Managed Infrastructure

SaaS: \$29 – \$299 / mo

We host the AI backend, database, and edge CDN. Customers get a fully working CMS with zero DevOps overhead.

→ Reliable recurring SaaS revenue.

03

Commerce Engine

Transaction Fees + Extensions

Native commerce layer where AI agents can sell products in conversation. Includes payment processing fees.

→ "A third of Automattic's revenue comes from WooCommerce."

04

Plugin Marketplace

15-30% Revenue Share

Curated, sandboxed plugin ecosystem. Developers sell premium extensions, themes, and agent skills. Tovu analogs of WordPress plugins can be rapidly created with AI assistance.

→ High-margin platform tax on ecosystem growth.

Compounding Advantages

Why we win long-term

01

Plugin Network Effects

More plugins make agents smarter (via MCP), attracting more users, which attracts more developers.

↗ Classic platform flywheel

02

AI Data Compounding

Every conversation makes the site's agents smarter. This context is not portable. Competitors start from zero.

🔒 High switching costs

03

Ad Network Density

More sites → better targeting → higher CPMs → more host revenue → more sites. The classic ad network flywheel.

💰 Monetization lock-in

04

Architectural Adaptability

Hexagonal core means we adopt new frameworks or AI models in days. Competitors have to rewrite their legacy codebase.

🔗 Technical agility

Migration Is the Wedge

Strategic roadmap to adoption

We don't need to convince developers to learn a new language. We just give them a better tool for the work they're already doing.

The Target

30M+ Active Sites

The migration tool is the most critical component. It turns "high switching cost" into "one-click upgrade."

01

Open-Source the Core

Targeting GitHub stars, dev community, & Hacker News.

02

WordPress Migration Tool

The Wedge

Agentic migration to export database, assets, and content.

03

Agency Channel

Partner program with wholesale pricing for dev shops.

04

Ad Network Launch

Activate monetization once site density reaches critical mass.

Pre-Product.

In Progress

Ready Foundation

- ✓ **Technical Architecture**
Hexagonal core designed & documented
- ✓ **Tech Stack Validated**

- ✓ **Prototype Components**
Agentic UI & V8 isolates

● Architectural Progress

Four-Phase Build Plan

Phase 1

Foundation

Core content engine, admin interface, authentication, and public API.

Status: In Progress

Phase 2

Plugins

Sandbox runtime, declared permissions system, agent-ready surface.

Status: Queued

Phase 3

AI Layer

Agent teams, MCP integration, RAG search, visitor + employee agents.

Status: Queued

FUNDING GOAL

Phase 4

Commerce

Native payments, edge deployment, real-time collaboration.

Status: Future

i Funding gets us through the **AI Layer (Phase 3)** — creating a differentiated, demo-able product.

We're Alone in the Quadrant That Matters

Strategic Positioning

Why This Gap Exists

Incumbents are trapped by legacy codebases (PHP) and cannot re-architect for AI agents without breaking backward compatibility for millions of users.

The "Headless" Trap

Headless CMS players (Contentful, Sanity, Strapi) sit outside this matrix. They have:

- ✗ No frontend layer
- ✗ No plugin ecosystem
- ✗ No migration path

Key Insight

Open source allows for plugin network effects. AI-native architecture allows for agentic monetization. Only Tovu has both.

Why Now

Three Converging Shifts

01

Agents Need Structure

LLMs struggle with unstructured HTML. **MCP (Model Context Protocol)** is becoming the standard. A CMS that speaks it natively isn't just a website tool—it's critical infrastructure for the AI era.

02

Chat Replaces Search

User behavior is shifting from "Google it" to "Ask AI." Sites without a conversational layer are losing traffic. Tovu provides this layer on **Day 1**—and monetizes it automatically.

03

TypeScript Ate the World

For the first time, the talent pool for TypeScript (14M+ devs) dwarfs PHP. We can finally build a WordPress-class CMS without technical debt. **Next.js is the new LAMP stack.**

WordPress captured the last 20 years.
Tovu is built for the next 20.

Building the Next Web

Founder & CEO

Leon Aburime

*"We're not building a better WordPress.
We're building what comes after it."*
